Defining homelessness

ROOFLESS

HOUSELESS

**INSECURE
HOUSING**

**INADEQUATE
HOUSING**

In Dec 2023
309,000
people in
England were
homeless

At outset of
COVID-19
pandemic, **5,000**
people
estimated to
need emergency
accommodation
in the UK

By March 2021,
“Everyone In”
had
accommodated
37,430 people

“Frailty is a health state related to aging where multiple body systems gradually lose their reserves and resilience”

(British Geriatric Society, 2014)

Phenotypic model

(Fried et al, 2001)

Model of cumulative deficit

(Rockwood et al, 2007)

Premature mortality

High levels of...

- **Long-term physical conditions**
- **Mental health problems**
- **Drug and alcohol use**

Challenges accessing healthcare

Research questions

- What is the prevalence of frailty in PEH?
- What factors are associated with frailty in this population?
- What could prevent and treat frailty in this population?

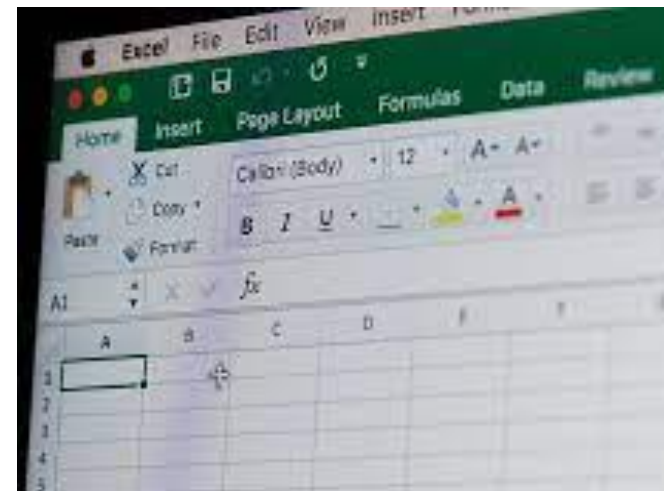

Aim

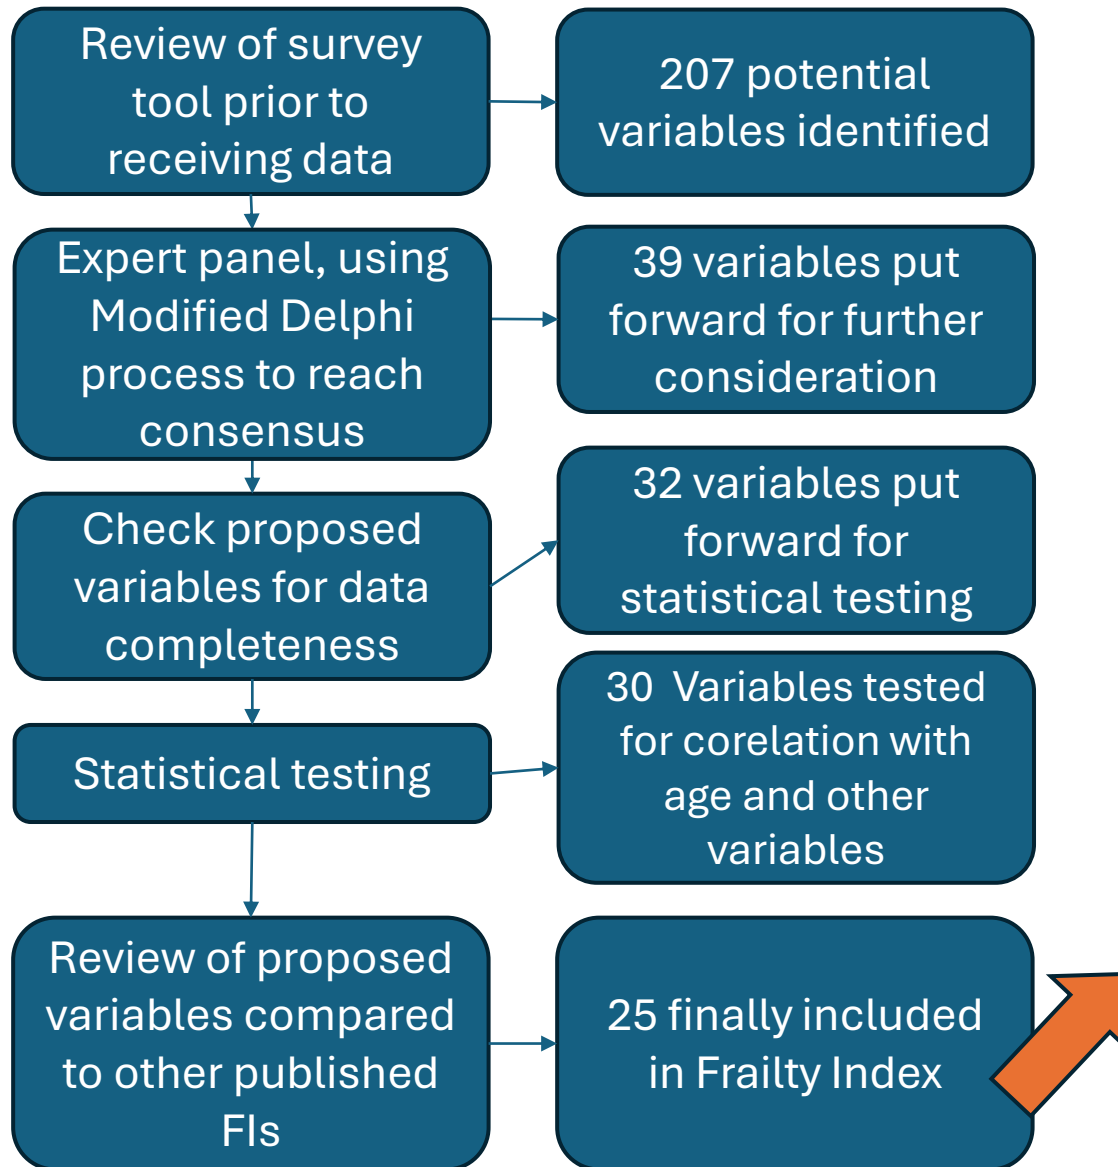

To use mixed methods research to inform the development of interventions to prevent and treat frailty in people experiencing homelessness

Homeless Link “Homeless Health Needs Audit” (HHNA) dataset

- Health survey data collected between 2015 and 2022
- All data collected from people experiencing homelessness at time of survey

Creation of the Frailty Index (FI)

Final included variables
Long term disability/infirmity
Heart problems
Cancer
High blood pressure
Difficulty seeing
Skin problems
Problems with feet
Fainting/blackouts
Urinary problems
Schizophrenia/bipolar disorder
Musculoskeletal problems
Diabetes
Self-reported health score
Problems with circulation/blood clots
Liver problems
Stomach problems, including ulcers
Dental/problems with teeth
Dual-diagnosis of mental health/substance use
Blood borne viruses, including HIV and Hep C
Breathing problems including TB
Epilepsy
Depression
Anxiety or phobias
Eating disorder
Asthma

- To calculate each participant's FI score, we will **sum the deficits** and **divide by the total number of deficits** measured:

$$FI = \frac{\text{No of deficits present on the individual}}{\text{No of deficits measured for that individual}}$$

- FI scores range from 0 to a theoretical maximum of 1.
- An individual must have data on at least 20/25 deficits for their score to be calculated

FINDINGS

Describing the population

Gender

72.7% men
26.4% women

Age

97.8% participants aged 18-65 years
88.0% participants aged 18-54 years

Ethnicity

86.1% White
12.1% Non-white

Accommodation

17.2% Roofless
64.9% Houseless
8.1% Insecure/ inadequate
9.3% Previously homeless, now housed

Immigration status

83.7% UK national
6.5% Non-UK
National

Recourse to public funds

73.7% Yes
2.4% No

Smoker

78.5% Yes
20.6% No

Has or is recovering from a drug problem

67.0% Yes
30.0% No

Alcohol consumption risk

30.0% Does not drink
33.8% Low risk
11.1% Increasing risk
24.9% High risk

Meals per average day

3.0% Zero
27.6% One
34.6% Two
19.7% Three or more

Self-reported health

9.1% Very bad
13.5% Bad
30.1% Fair
24.8% Good
14.8% Very good

FINDINGS

Prevalence of frailty

	Not frail	Pre-frail	Frail	Total
People experiencing homelessness	338	1,001	949	2,288
%	14.8	43.8	41.5	100

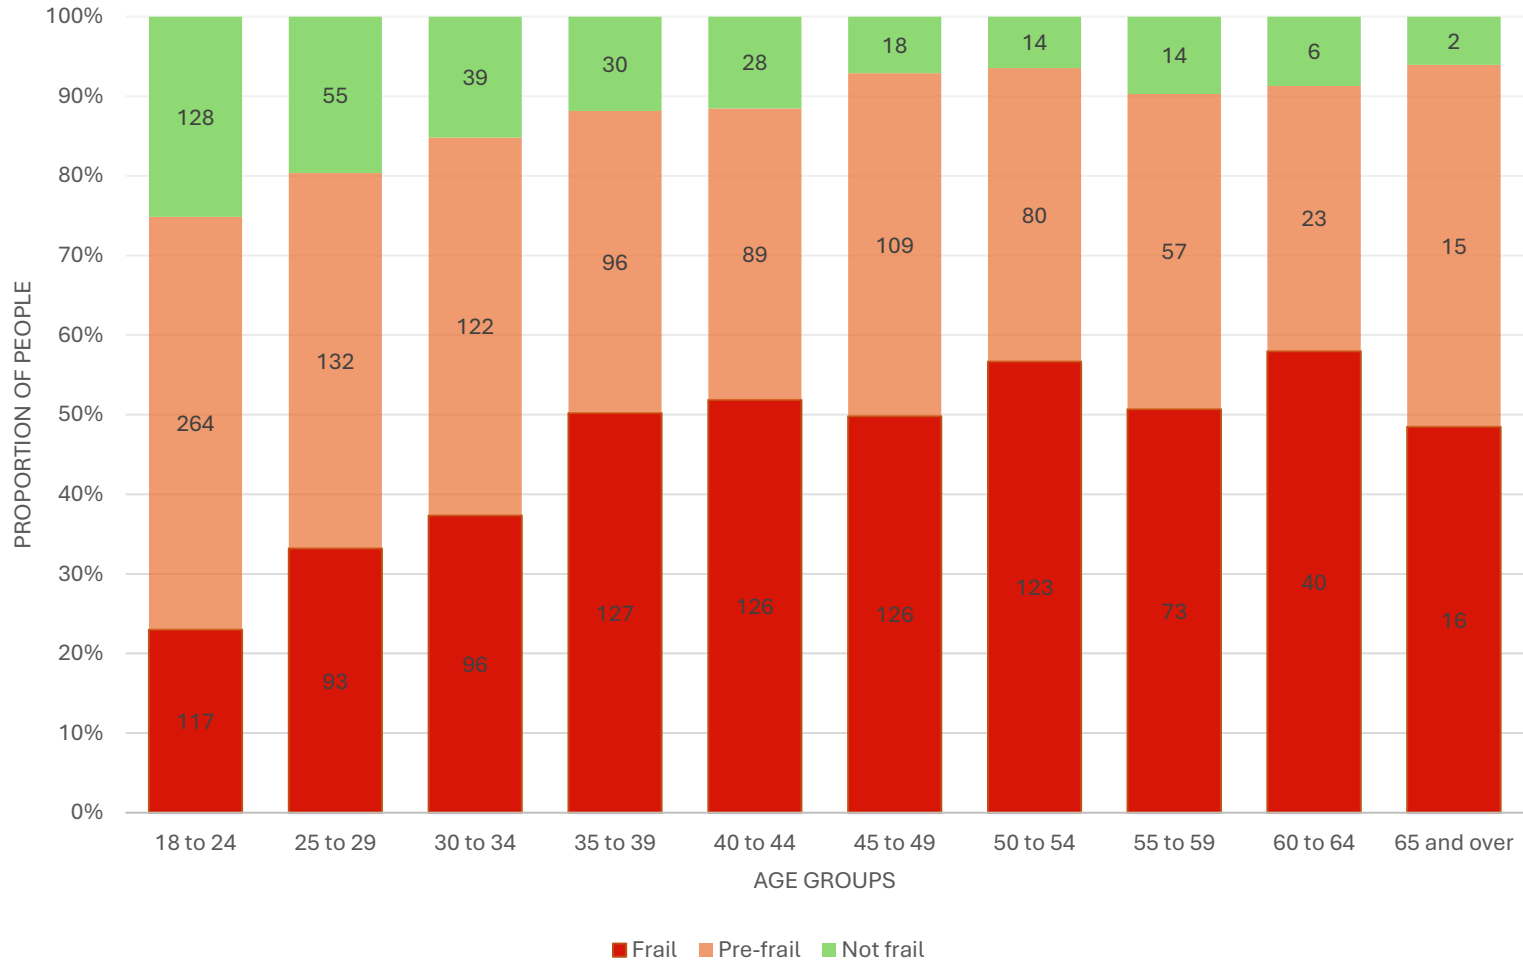

People who are **homeless** are **frail** in far **higher proportions** (41%) than the general population who are of a comparable age (8%).

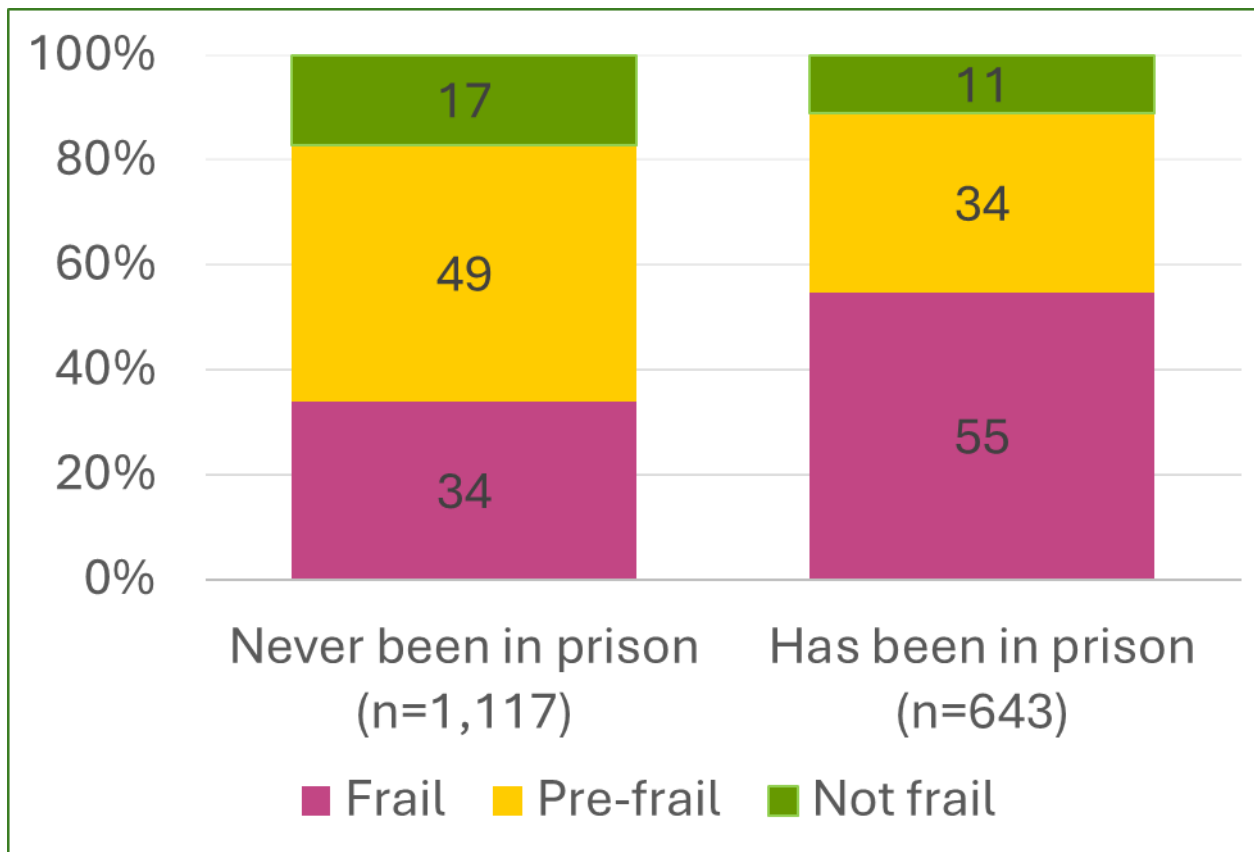

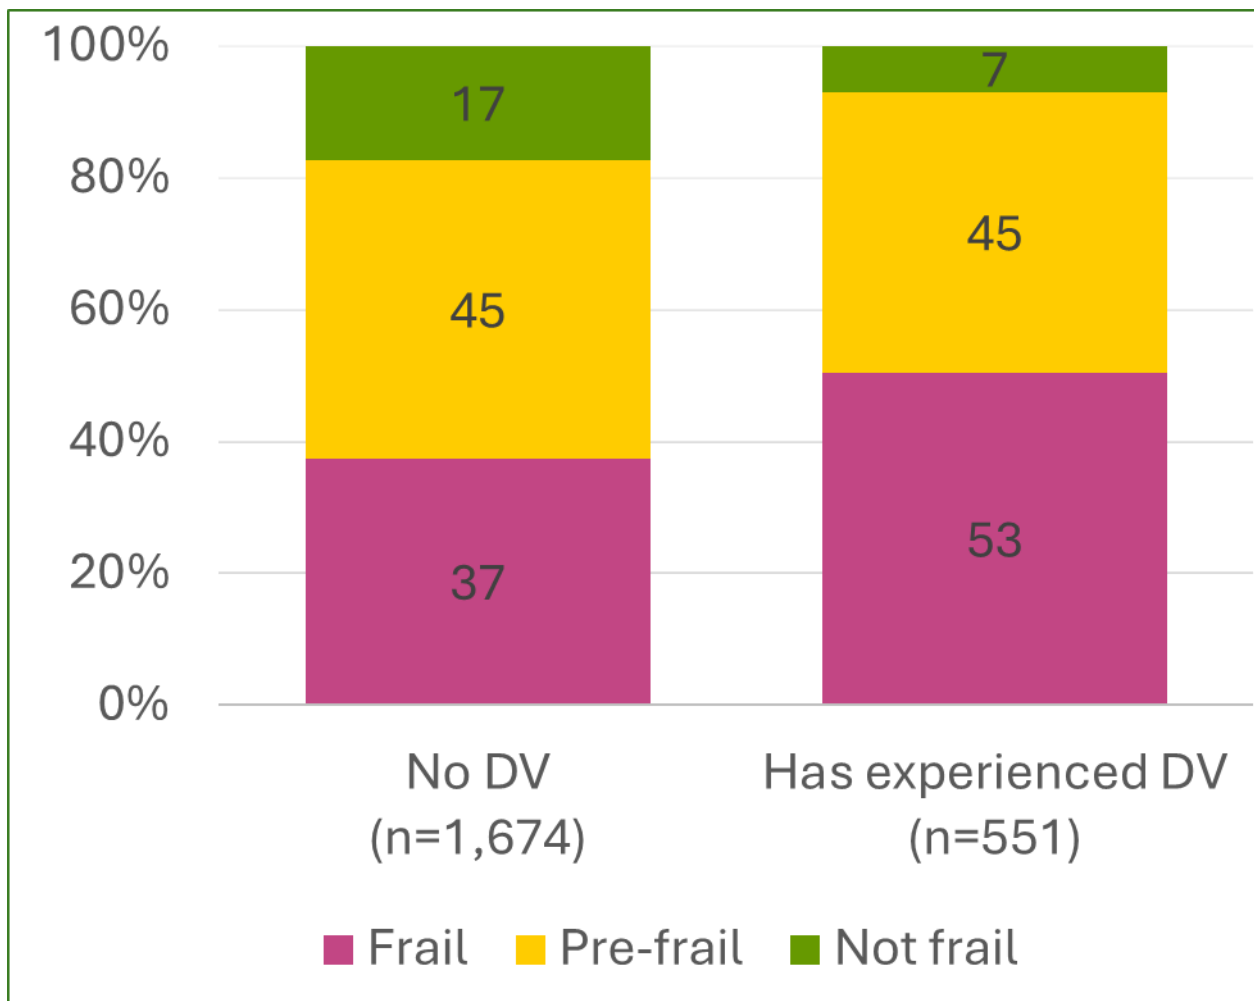

FINDINGS

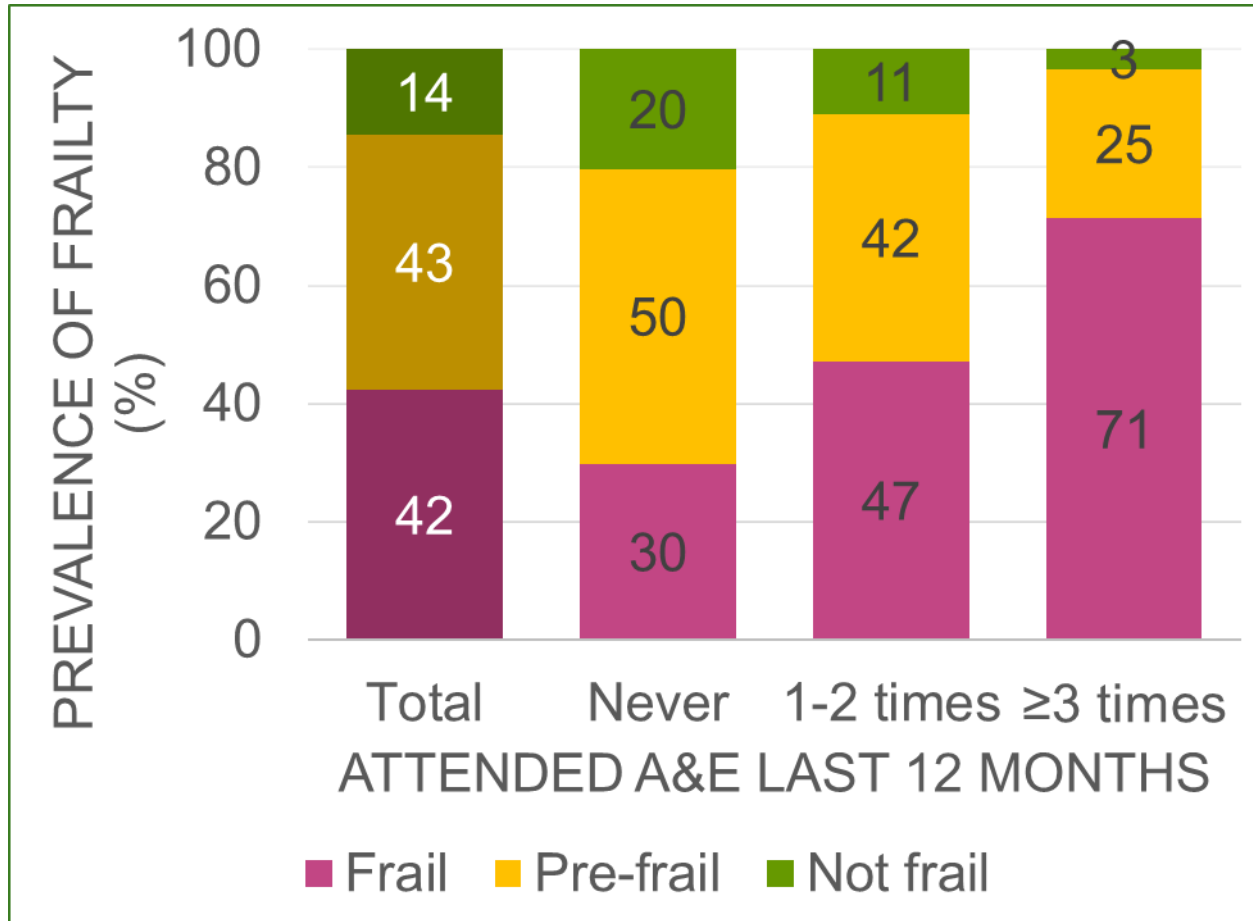

Factors associated with frailty

FRAILITY BY AGE

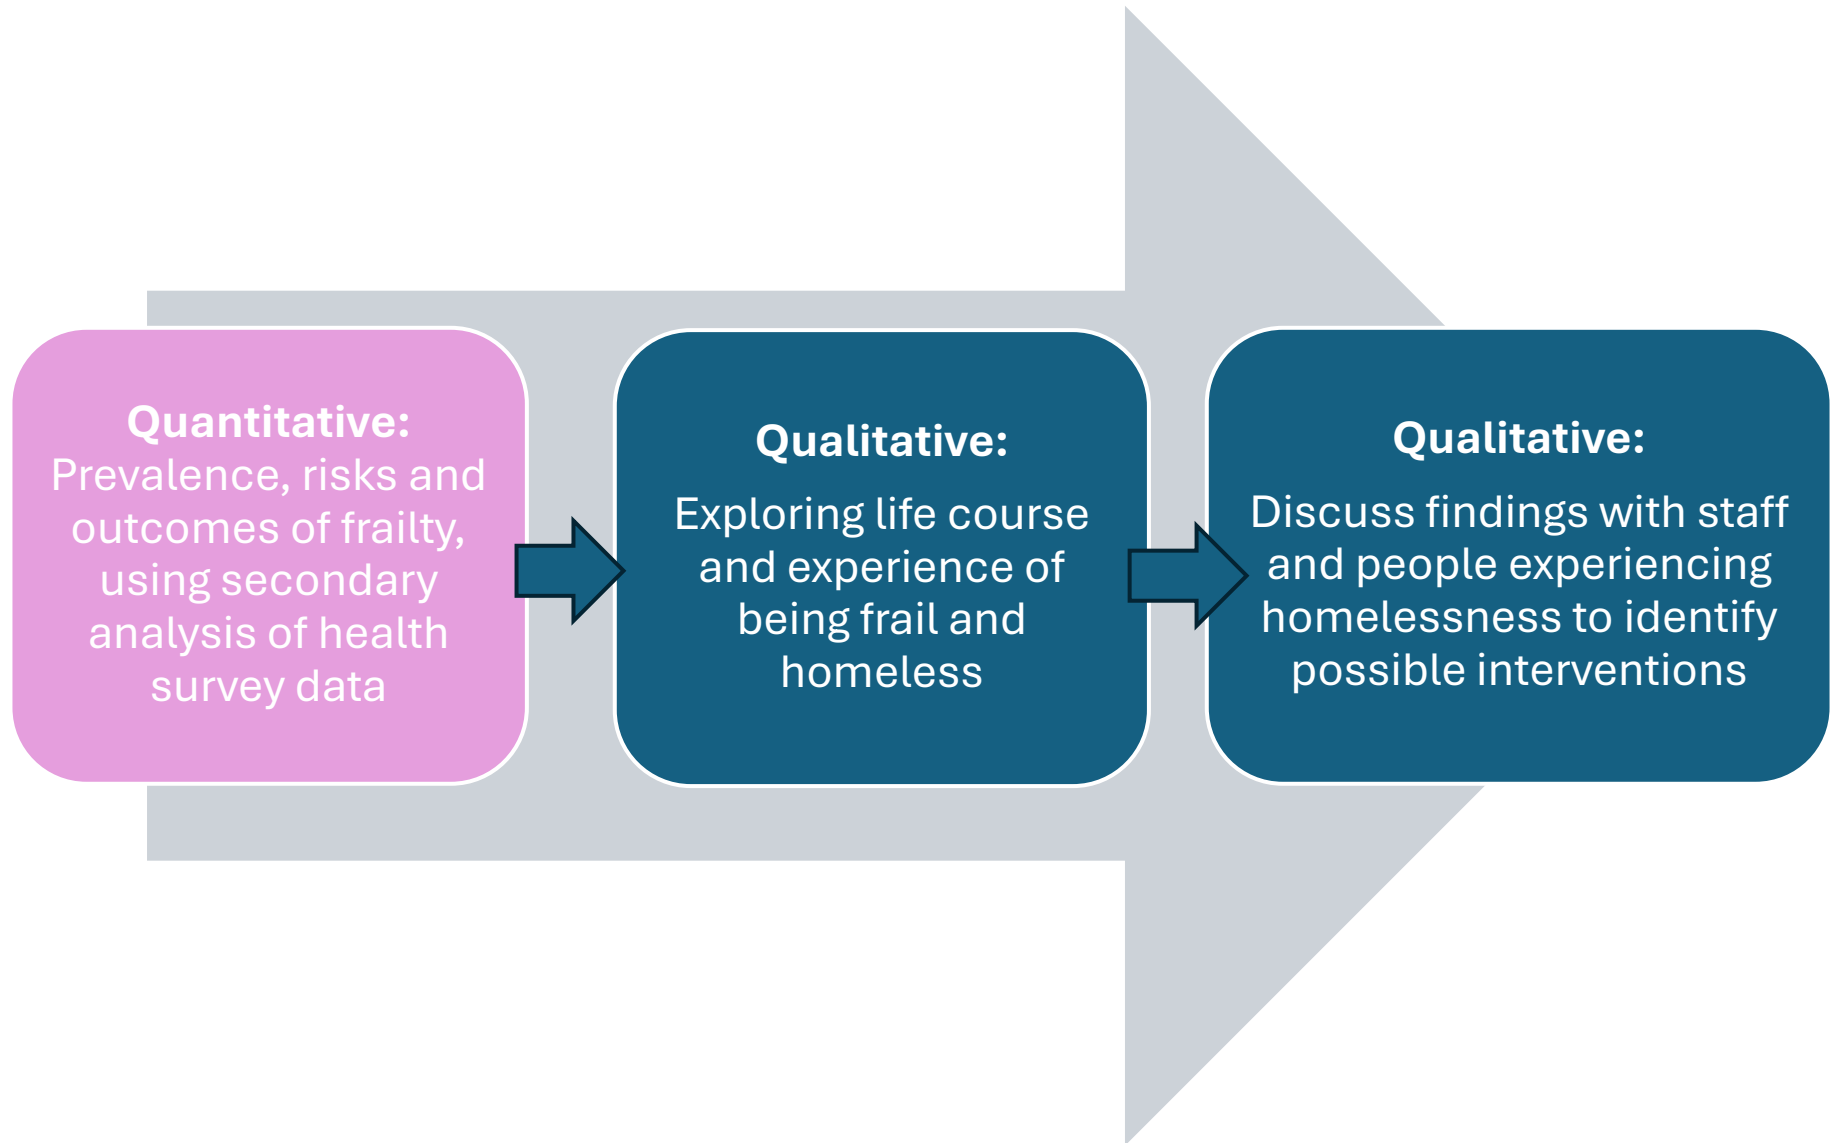

Strengths

- Sample size
- Robust approach to FI development
- Data collection methods

Limitations

- Cross-sectional nature of study
- Difficulty quantifying “hidden homeless” missed
- Survey designed without frailty in mind

Future work: addressing frailty in people experiencing homelessness
